

Web Development : Angular Assignment - 3

1. Create Angular Application which contains two components and display the contents of that two components after the root components. Expected output of our application should be

Inside Root component

Inside First Component

Inside Second component

Create new components using ng generate command and add its markups in app.component.html file.

2. Create the application which contains two components as First and second Display specific text from both the component. Text of first component should be displayed in Red colour and for second component use Blue colour.

Follow same steps as the above application. As we want to specify the colours we have to write the colours specification in appropriate .css file of each component.

3. Create angular application which contains one user defined function inside class. We have to call that function using String interpolation.

Write one public function inside class named as fun() and call that function inside {{ call }}.

4. Create application which display length of the string which is characteristics of the class as well as we have to convert that string into upper case.

To solve this question we can use length property and ToUpperCase() function inside sting interpolation.

5. Create angular application which one button. When user press that button we have to display some text as "Button Clicked" otherwise display "Marvellous Infosystems".

As we want to handle event of button click we have to use this tag as (click)= "fun()".

In this case inside the fun function we will change the text.
